

AMENDMENTS TO THE CLAIMS

Please cancel claim 4 without prejudice.

Please amend the claims as follows:

1. (Currently amended) A data collection system comprising:
 - a GSM network;
 - a user application server coupled to said GSM network;
 - a data terminal apparatus including a communications bridge, a first interface, and a wireless radio, said wireless radio configured to connect to said GSM network; and
 - a user equipment coupled to said data terminal apparatus through said first interface, said user equipment configured to collect and send data through said first interface as if said user equipment is communicating over a circuit switched call link; wherein:
 - said communications bridge is configured to simulate said circuit switched call link to said user equipment and to communicate said data over said GSM network through said wireless radio using a non-circuit switched call link, and said GSM network is configured to route said data to said user application server for processing[[]] , and
 - said communications bridge comprises application layer object code built over a GSM protocol stack associated with said wireless radio, said application layer object code being configured to handle incoming

AT commands from said user equipment and handle said
simulation of said circuit switched call link to said user equipment.

2. (Original) The data collection system of claim 1, wherein said non-circuit switched call link is made via one or more short message service messages.
3. (Previously presented) The data collection system of claim 1, wherein said non-circuit switched call link is made via one or more general packet radio service messages.
4. (Cancelled)
5. (Previously presented) The data collection system of claim 1, said communications bridge further comprising a preprocessor unit, said preprocessor unit comprising:
a microcontroller;
a non-volatile memory coupled to said microcontroller;
a volatile memory coupled to said microcontroller; and
an input output controller coupled to said microcontroller, said input output controller including said first interface and a second interface, said wireless radio coupled to said microcontroller through said second interface.
6. (Previously presented) The data collection system of claim 1, wherein said communications bridge is configured to packetize data received from said first interface into short message service format.

7. (Original) The data collection system of claim 1, wherein said communications bridge is configured to packetize data received from said first interface into general packet radio service format.
8. (Currently amended) A method for collecting data over a GSM network comprising:
receiving data at a data terminal apparatus from a user equipment;
simulating a circuit switched call link response to said user equipment, wherein
the simulation of the circuit switched call link is provided utilizing
application layer object code built over a GSM protocol stack, the
application layer object code being configured to handle incoming AT
commands from said user equipment and handle said simulation of said
circuit switched call link to said user equipment;
packetizing said received data into packets for transmission over a non-circuit
switch call link to said GSM network;
transmitting said packetized data over said GSM network; and
routing said packetized data through said GSM network to a user application
server.
9. (Original) The method of claim 8, wherein said packets are short message service packets.
10. (Original) The method of claim 8, wherein said packets are general packet radio service packets.

11. (Currently amended) A method for receiving information over a GSM network comprising:
- transmitting a packet of information over said GSM network, said packet being intended for a user equipment;
- receiving said packet of information at a data terminal apparatus;
- establishing a simulated circuit switched call link between said data terminal apparatus and said user equipment, wherein the simulated circuit switched call link is provided utilizing application layer object code built over a GSM protocol stack, the application layer object code being configured to handle incoming AT commands from said user equipment and handle simulation of said circuit switched call link to said user equipment;
- transforming said packet of information into serial data information; and
- sending said serial data information from said data terminal apparatus to said user equipment over said simulated circuit switched call link.
12. (Original) The method of claim 11, wherein said packet of information is in short message service format.
13. (Original) The method of claim 11, wherein said packet of information is in general packet radio service format.
14. (Currently amended) A computer-readable medium having stored therein sequences of instructions for collecting data over a GSM network, said one or more sequences of instructions causing one or more processing to perform the acts of:

receiving data at a data terminal apparatus from a user equipment;
simulating a circuit switched call link response to said user equipment, wherein
the simulation of the circuit switched call response to the user equipment
is provided utilizing application layer object code built over a GSM
protocol stack, the application layer object code being configured to
handle incoming AT commands from said user equipment and handle
simulation of said circuit switched call link to said user equipment;
packetizing said received data into packets for transmission over a non-circuit
switch call link to said GSM network;
transmitting said packetized data over said GSM network; and
routing said packetized data through said GSM network to a user application
server.

15. (Original) The computer readable medium of claim 14, wherein said packets are short message service packets.
16. (Original) The computer readable medium of claim 14, wherein said packets are general packet radio service packets.
17. (Currently amended) A computer readable medium having stored therein sequences of instructions for receiving information over a GSM network, said one or more sequences of instructions causing one or more processors to perform the steps of:

transmitting a packet of information over said GSM network, said packet being intended for a user equipment;

receiving said packet of information at a data terminal apparatus;
establishing a simulated circuit switched call link between said data terminal apparatus and said user equipment, wherein the simulated circuit switched call link is provided utilizing application layer object code built over a GSM protocol stack, the application layer object code being configured to handle incoming AT commands from said user equipment and handle simulation of said circuit switched call link to said user equipment;
transforming said packet of information into serial data information; and
sending said serial data information from said data terminal apparatus to said user equipment over said simulated circuit switched call link.

18. (Original) The computer readable medium of claim 17, wherein said packet of information is in short message service format.
19. (Original) The computer readable medium of claim 17, wherein said packet of information is in general packet radio service format.
